Is there a bad/good fire?

Paulo Fernandes

Centro de Investigação e de Tecnologias
Agroambientais e Biológicas (CITAB),

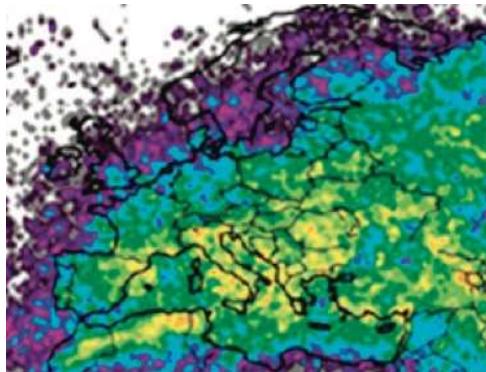

Universidade de Trás-os-Montes e Alto Douro,
Portugal

Fire in European ecosystems

Lightning-ignited fires

Human-ignited fires

Temperate Europe

Boreal Europe

Mediterranean Europe

More forest and shrubland, decrease in use and management

Fuel accumulation

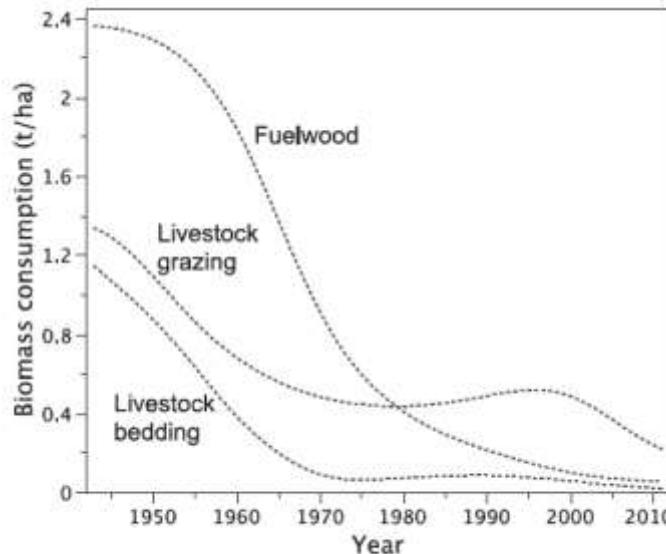

Increase in connectivity, decrease in pyrodiversity

More frequent and more severe extreme fire weather events

Fire regime shift: 1960s-1970s

Biomass (fuel) trends

Fuel hazard trends

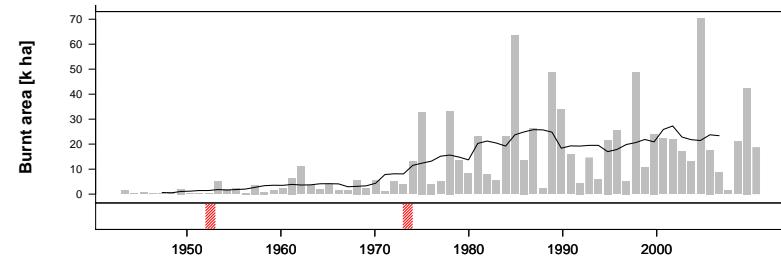

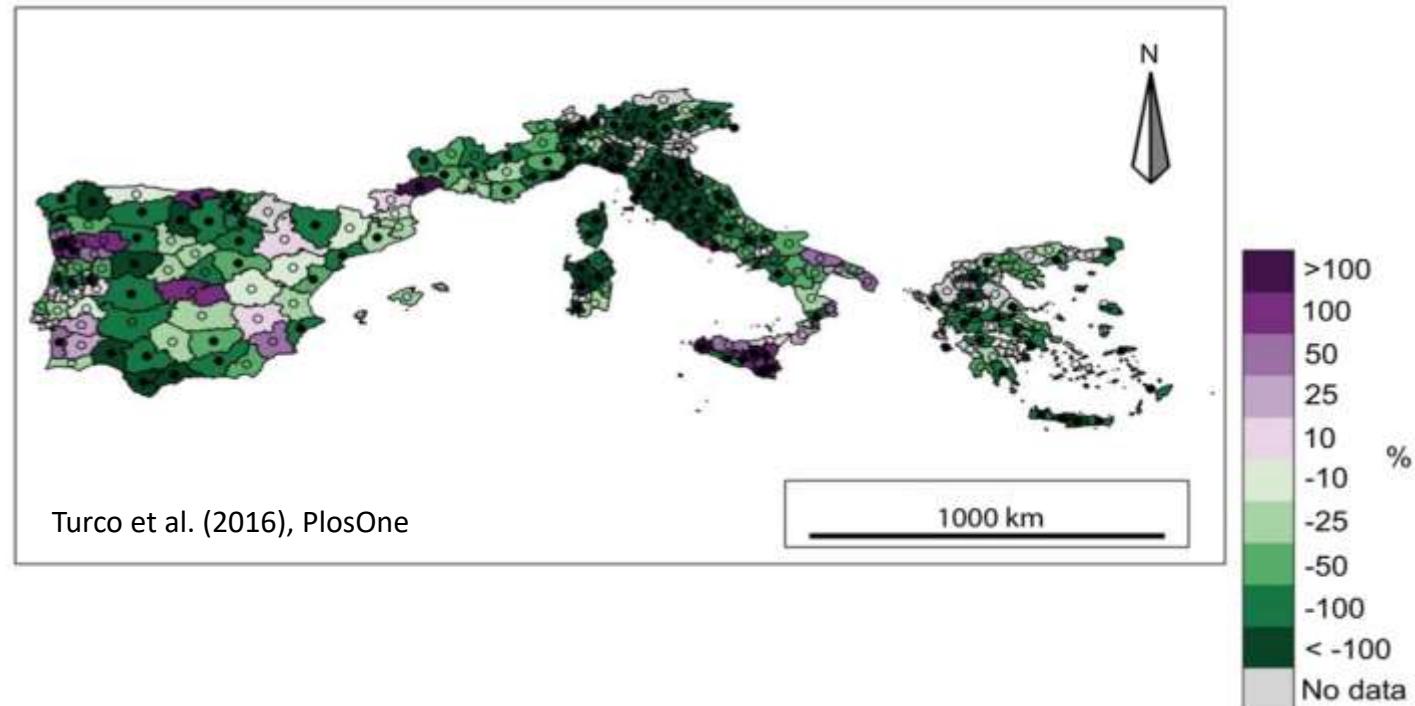

Fig. 2. Time series (1943–2011) of modelled dynamics of biomass consumption in the Portuguese public forest.

Fig. 3. Time series (1943–2011) of fuel hazard in the Portuguese public forest.

Fire regime shift: 1990s

~66%
decrease in
burned area
**due to fire
exclusion
policies**

Fire regime shift: 1990s

Turco et al. (2016), PlosOne

Increased
burned
area in
Autumn to
Spring

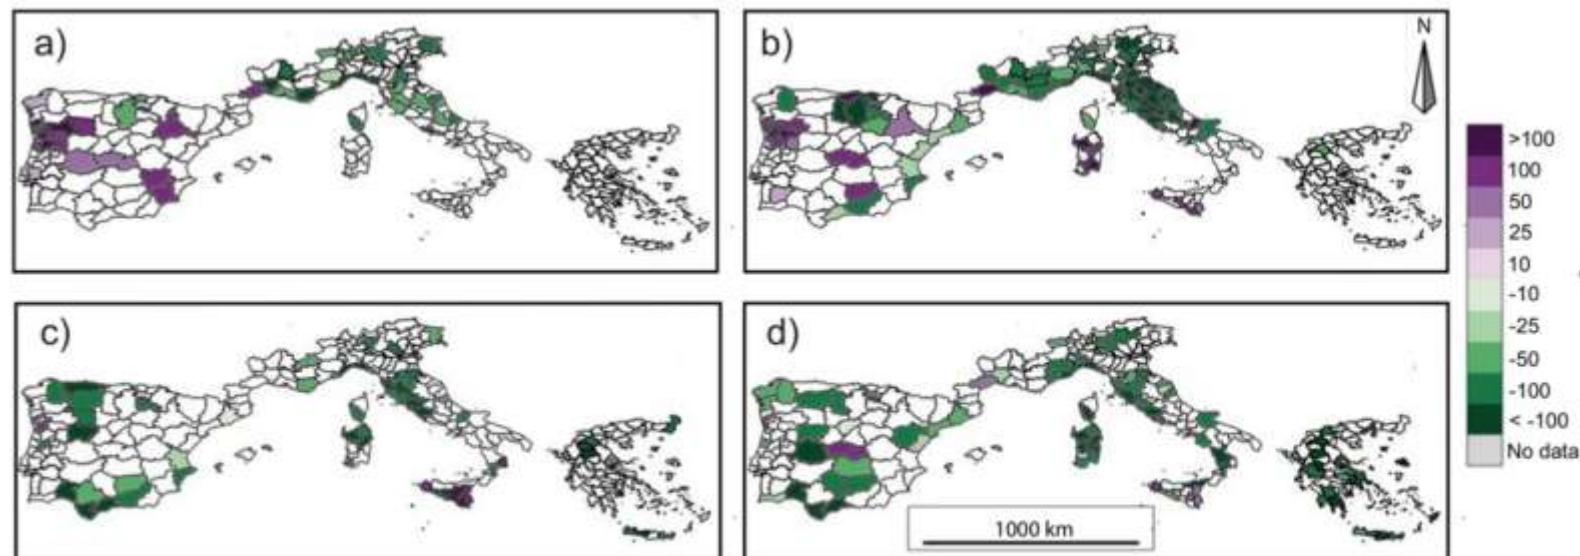

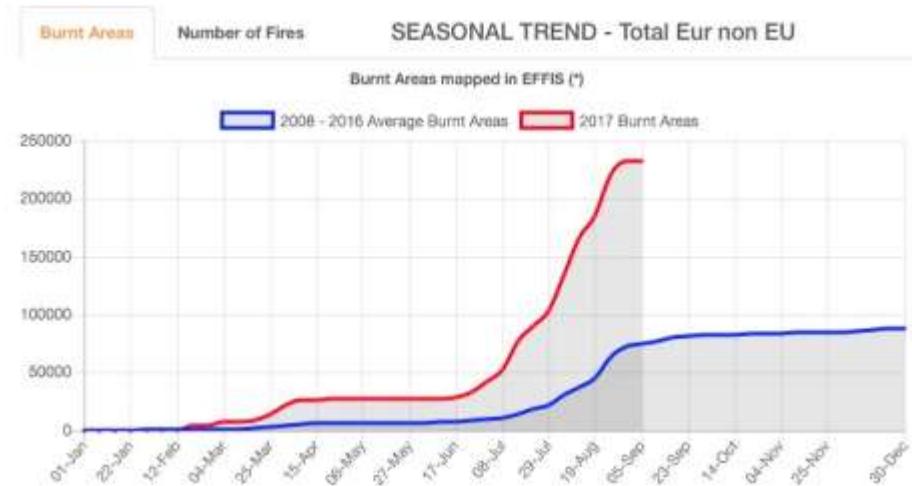

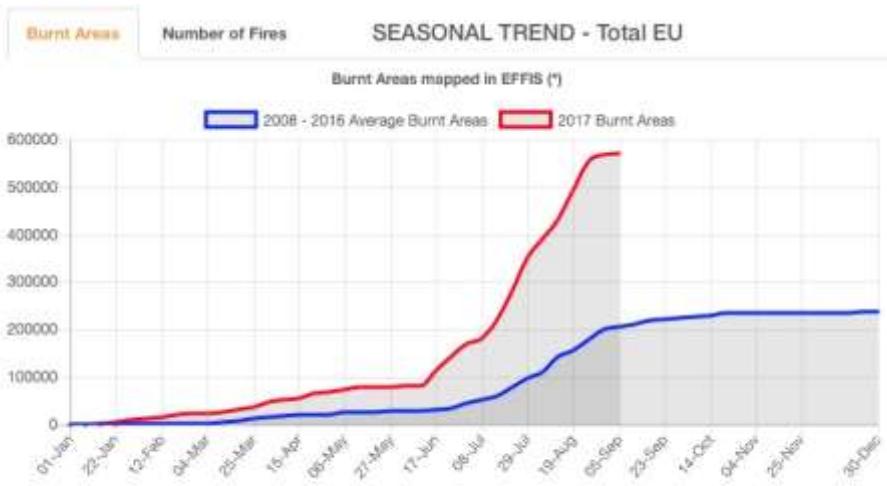

Fig 7. Seasonal trends of the burned area for the period 1985-2011 for (a) December-January-February (DJF), (b) March-April-May (MAM), (c) June-July-August (JJA) and (d) September-October-November (SON). NUTS3 units with more than 5 years of missing data are excluded from the analysis. Only significant trends ($p < 0.05$) are shown. Trends are represented as the percentages of the total trend for the available period (e.g. ha per 27 years) divided by the historical mean calculated over the same period (e.g. 1985-2011).

Wildfires in Europe

Mean annual burned area:
324,500 hectares

2017 burned area (so far):
801,700 hectares

(*) The burnt areas mapped in EFFIS represent, on average, about 80% of the total area burned by wildfires, since only fires larger than 30 ha are mapped. The area burnt by fires smaller than 30 ha represent about 20% of the total burnt area in each country, but this area not mapped in EFFIS.

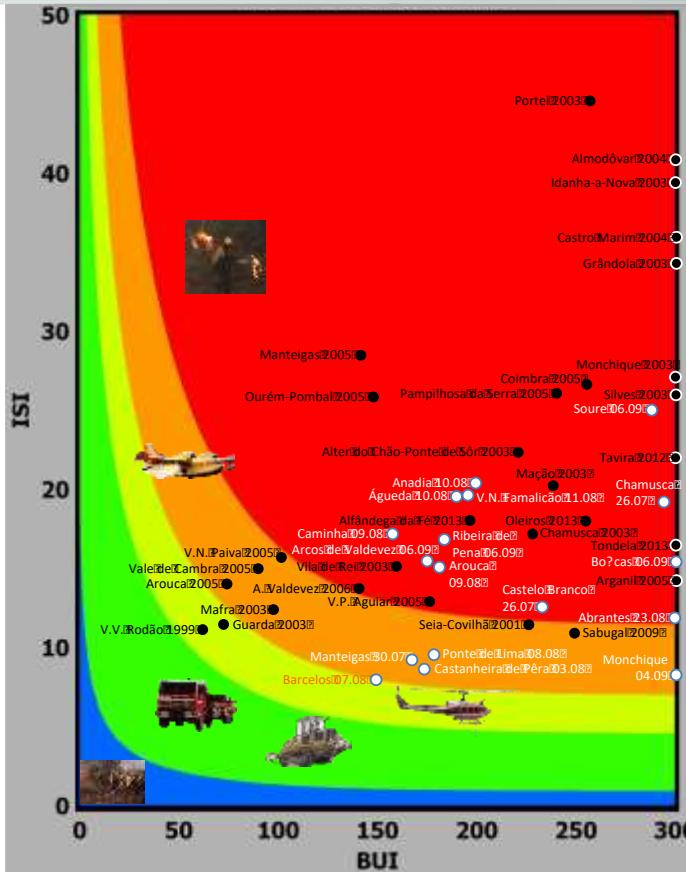

Fire use in a changing landscape, under a changing climate

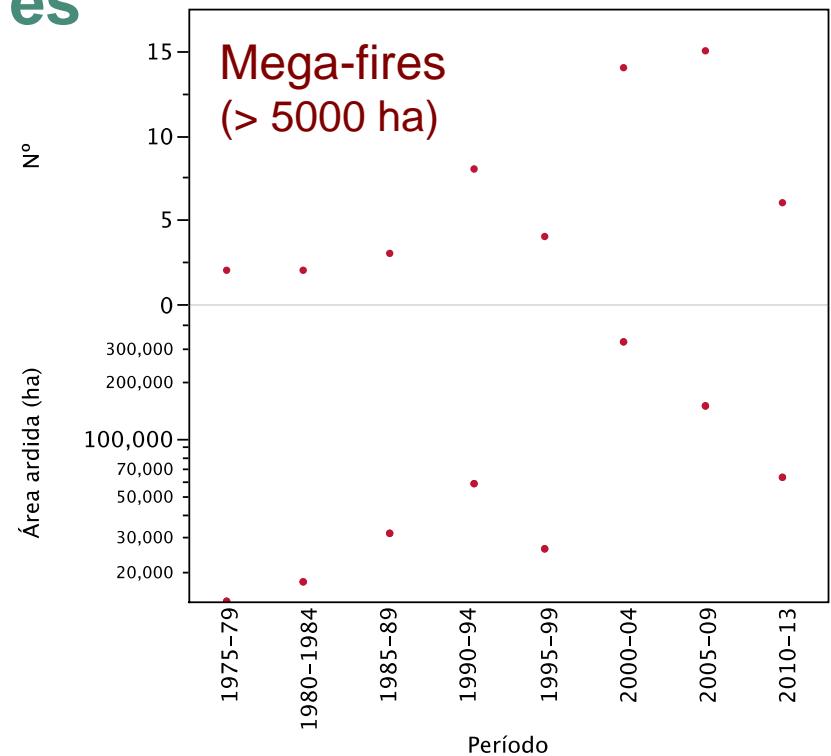

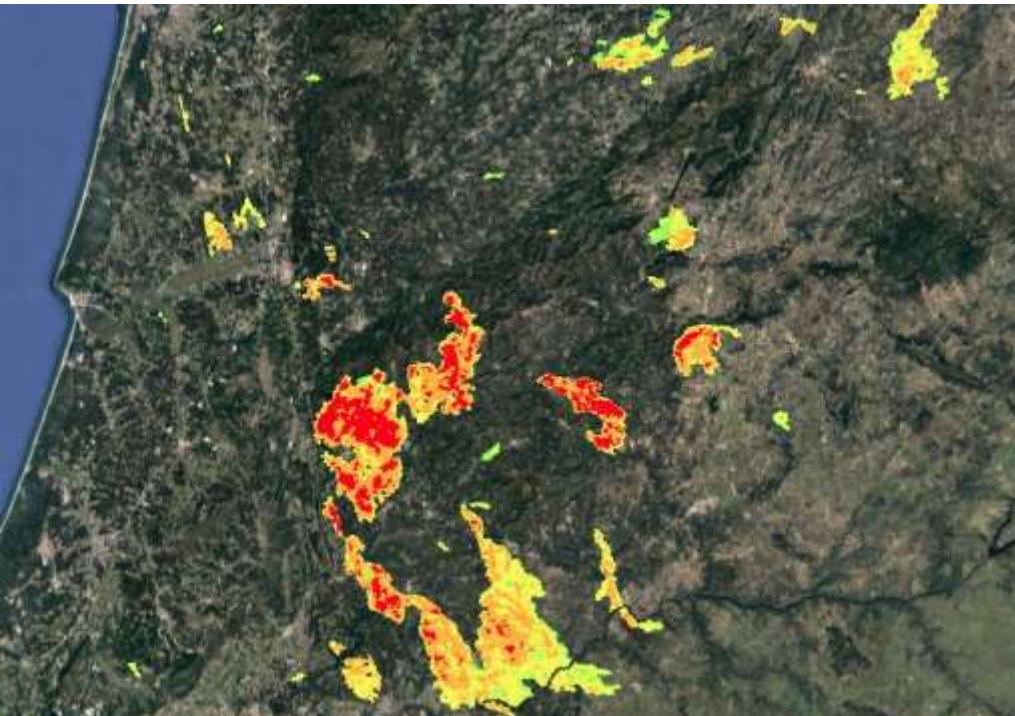

Increasingly larger and severe fires

Extreme weather conditions overwhelm fire suppression resources

- 2016 large wildfires
- Past wildfires >2500 ha

Increasingly larger and severe fires

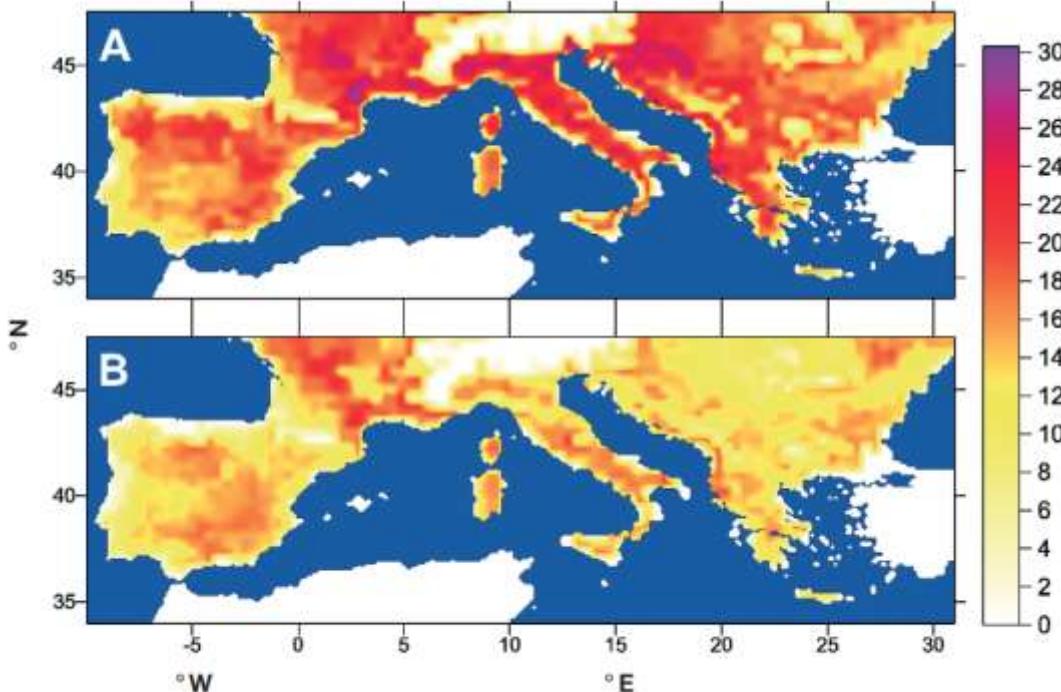

Extreme and potentially catastrophic fire behaviour

- 
- Plume-driven fire
 - Vorticity
 - Profuse spotting
 - Fire-induced lightning
 - Downburst and very fast rate of spread

2071-2100 fire danger forecasts

Moriondo et al. (2006), Climate Research 31: 85-95

- Increased mean fire danger
- Longer fire season
- Increased maximum daily fire danger
- More days with extreme fire danger
- More episodes of persistent (>7 days) extreme fire danger

Fig. 11. Percentage changes of no. of days with FWI > 45 for (A) A2 and (B) B2 scenarios

Values threatened by ‘bad fires’

Wildland-urban interfaces

Rural communities safety
and livelihoods

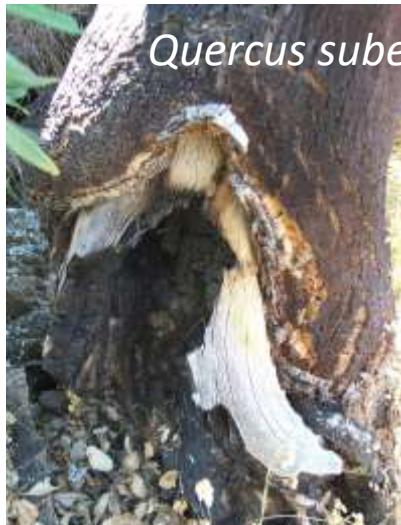

Commercial forestry

Mediterranean ecosystems: adapted and resilient to fire

Strategies: individual (resistance - thick bark, self-thinning; vegetative response – sprouting) versus population (seeding)

Mediterranean ecosystems: Adapted and resilient to fire, but not necessarily to all fire regimes

E.g. mountain pines, adapted to low severity, frequent fires

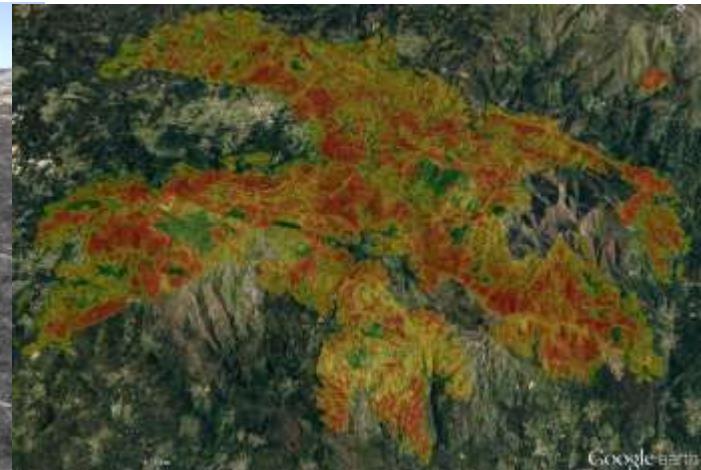

Pinus sylvestris

Pinus nigra

“Good fire” in hazard reduction: large fires are impacted by previous fires

- Wildfire spread constrained by pastoral burning
- Highly variable burn severity
- Unburnt islands and low/moderate severity associated to recent fires

Prescribed burning (“good fire”) in hazard reduction

Fernandes et al. (2004), Ann. For. Sci.

Untreated

Crown fire

Fireline intensity = 2000 – 11000 kW m⁻¹

Tree mortality = 100%

13 yrs. after treatment

Experimental evidence, *Pinus pinaster* stand in NE Portugal

3 yrs. after treatment

Surface fire

Fireline intensity = 200–1000 kW m⁻¹

Tree mortality = 41–55%

2 yrs. after treatment

Prescribed burning (“good fire”) in hazard reduction

Riserva Tirone Alto Vesuvio, Italy, 18 July 2017

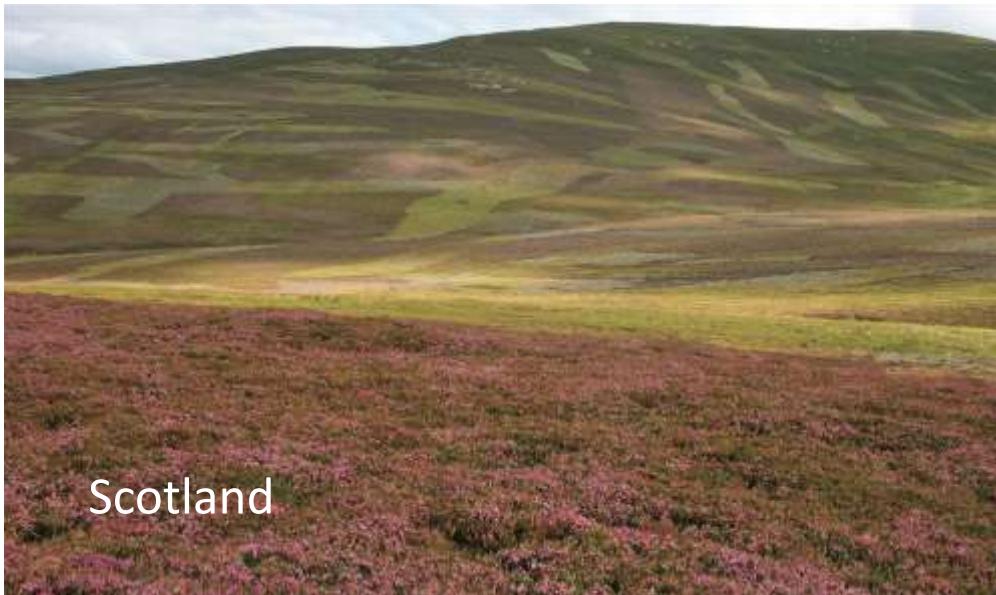

Prescribed burnt vs. untreated *Pinus pinaster* stand

Battipaglia et al. (2017), Forest@

Prescribed burning (“good fire”) in habitat management and nature conservation

Prescribed burning (“good fire”) in habitat management and nature conservation

Light & Fire LIFE Project 2014–2020

- Forest restoration
- Restoration of sunlit habitats
- Restoration of Baltic sandy beaches
- Habitat restoration of *Pulsatilla patens*
- Camps for volunteers
- Management planning
- Fire for Life Workshop
